

SmartForm

Bearer and Joist Design Guide

SmartForm®

Description

SmartForm LVL is a softwood structural laminated veneer lumber (LVL) manufactured for Tilling Timber by world class LVL manufacturers to meet the quality controlled process requirements of AS/NZS 4357 - Structural Laminated Veneer Lumber. It is produced in industry standard sizes, painted orange for easy visual identification, and is intended for use as concrete formwork support structures such as joists, bearers, walers and soldiers.

Quality

Compliance with process based quality control requirements is third party audited these audits, together with end product testing is used as the basis for Product Certification.

Marking

Each piece of SmartForm is branded at least once with the SmartForm branding compliant with AS/NZS 4357 structural LVL standard for identification and evidence of compliance with manufacturing control standards and product quality certification. It is also sealed with a water resistant orange coating to increase its durability, providing the user with extended lifecycles and superior performance.

Scope of these tables

This Design Guide and load tables assist in the selection of SmartForm formwork materials in standard applications. All load tables in this document are developed using in-grade tested characteristic properties of SmartForm as distributed by Tilling Timber. Other look-alike substitution LVL formwork products manufactured by different producers may have different properties, and their specification from these tables may create an unsafe support system or unsatisfactory performance.

This publication is therefore strictly limited to the design of joists and bearers in common formwork applications. Reference should

be made to AS 3610-1995 plus supplements 1 and 2 and an experienced structural engineer for methods and details of developing lateral restraint, providing suitable vertical support to joists and bearers in the above tables as well as the robustness and stability of the formwork system as a whole.

Technical Support

This Design Guide covers only the most common formwork applications. For applications, service classes not covered in this Design Guide and/or general product enquiries about SmartForm, please contact Tech support on 1300 668 690 or at techsupport@tilling.com.au

Storage and Handling

1. Store SmartForm flat on a hard, dry surface
2. If surface isn't paved, the ground should be covered with a polythene film
3. Keep covered with waterproof material that allows bundles to "breathe"
4. Use bearers (bolsters) between the ground and the first bundle (4 metre max spacing)
5. Use 100 x 50 timber flat between bundles at same spacing as bolsters
6. Take great care to rewrap remaining material after opening bundles
7. Wood "grows" in thickness and depth when allowed to get wet....KEEP DRY!
8. Wood with high MC has short term reduction in Characteristic Strengths KEEP DRY!
9. Under NO circumstances are stored SmartForm to be in contact with the ground.

SmartForm specifications

Veneer:

- Species	Pinus massoniana (Masson pine) and/or Larix sibirica (Larch)
- Thickness (normal)	1.9 - 3.2 mm
- Joints	Scarf/overlap

Adhesive:

Phenolic – Type A AS 2754.1

Density:

Average value 600 - 720 kg/m³

Finish:

Un-sanded faces, arised edges – painted a distinctive colour

Dimensional tolerances:

- Depth	-0, +2.0 mm
- Thickness	-1, +2.0 mm
- Length	-0, +10 mm

Standard supply lengths:

6.0, 5.4, 4.8, 4.2, 3.6 and 3.0 metres

SmartForm - "F" grade timber comparison

LVL is an engineered timber product whose characteristic strength properties are derived by in-grade testing to AS/NZS 4063. "F" grades are assigned after visual grading of the solid timber to the appropriate standards.

There is no direct link between "F" graded timber and in-grade tested timber.

Notwithstanding the above, SmartForm may be used to safely substitute "F" graded material up to and including F8.

SmartForm section properties				
SmartForm size D x B mm	Self weight kg/m	Rigidity EI $\times 10^9$ N.mm ²	Design capacity	
			Bending ϕM kN.m	Shear ϕV kN
95 x 45	23	38.6	2.6	10.9
95 x 63	3.2	54.0	3.7	15.3
130 x 75	5.3	164.8	8.3	24.9
150 x 75	6.1	253.1	11.0	28.7

Design capacities for the table are based upon the following criteria:

- Capacity reduction factor $\phi = 0.90$ (Primary Structural elements other than houses table 2.5 AS 1720.1)
- $k_1 = 0.94$ (duration of 5 days) AS 1720.1
- Full lateral restraint

Formwork Design Process

The design of formwork always starts with defining the quality of the finished concrete surface. This is usually communicated through the project documents. Surface quality is effected by the extent to which the formwork components deflect under the applied loadings. Physical quality and tolerances, detailed in AS 3610 tables 3.3.1 and 3.4.2 guide the formwork designer in the selection of formface material and deflection limits for the framing members for soffits and wall forms. The tables include the deflection criteria for the most common classes of finish, namely: **Class 3 - Maximum of 3 mm or span/270**

Span tables for alternative deflection limits are available by contacting the Tech Support Customer Helpline on 1300 668 690 or at techsupport@tilling.com.au

The design aids in this design guide are confined to the selection of SmartForm LVL members which ensure that the formwork provides the strength and rigidity necessary to meet both

structural safety and surface quality requirements. Structural safety is limited to the selection of individual structural components subject to normal concrete pressures. This design guide does NOT address the structural safety of the system that may be subject to a wide range of abnormal and accidental loads. Methods for developing lateral restraint, providing adequate support as well as the overall stability of the structure are outside the scope of this publication.

The members in this table have been designed based upon the addition of the "Global load factor for primary member" introduced into AS 3610 - 1995 with Amendment 1 - 2003.

For horizontal members such as bearers and joists for soffits, both the joists and bearers have been considered primary members. For vertical forms, the soldiers have been considered primary members.

Conventional soffit formwork for slabs

SmartForm joists for concrete slab soffits

Notes for use with table

- Minimum bearing length = 45 mm at end supports.
- Spans in tables have been designed as per section 4 of AS 3610-1995, **including Amendment 1:2003** for all stage 1, 2 and 3 loadings. This allows for a 4.0 KPa imposed load due to stacked material as a stage 3 loading. This load is considered to be additional to other live loads. If the project designer applies limitations to restrict these material loads to a lesser amount (as specified in Clause 2.3(b) of AS 3610 - 1995), then larger spans will be achieved.
- Since the finish quality is dependent upon a number of factors including the formface used and the accuracy of the setup, a class 3 finish cannot be guaranteed.
- For multiple spans, the design has assumed the most conservative of 2 and 3 spans and that all spans are essentially equal.
- The design has assumed that the joists are continually restrained by the sheeting and the bearers are restrained by the joists.
- The design tables are only suitable for horizontal forms. For angled soffits, consult a formwork designer.
- To satisfy the bearing requirements of the timber, the breadth of the bearer must be equal to or greater than the breadth of the joists it is supporting.

Example vertical forms using SmartForm bearers and joists

Vertical formface up to 1800 mm

Soldier spacing (mm)	Formface specifications (Max 1800 mm high)		
	Plywood construction	Stress grade	Orientation *
300	17-10-7 17-16-7	F11 F14	H or V H Only
400	17-10-7	F17	H or V
450	17-10-7	F27	H or V

Notes:
 * - H denotes face grain horizontal
 - V denotes face grain vertical
 Maximum un-factored concrete pressure - 43 KPa

Tie-rod spacing
 - 1000 mm for walers continuous over 3 or more
 Tie-rod supports
 - 800 mm for walers supported by 2 tie-rods only

Vertical formface up to 3000 mm

Tie-rod spacing
 - 750 mm for walers continuous over 3 or more
 Tie-rod supports
 - 700 mm for walers supported by 2 tie-rods only

Example vertical forms using SmartForm bearers and joists (Cont'd)

Vertical formface up to 3900 mm

Standard vertical Forms

1. The design of the vertical forms is based upon a hydrostatic pressure distribution
2. Deflections of soldiers and walers have been limited to the greater of span/270 or 3 mm complying with class 3 finish in AS 3610 - 1995. Since the finish quality is dependent upon a number of factors including the formface used and the accuracy of the setup, a class 3 finish cannot be guaranteed
3. Tie bolt holes are not to be drilled through ANY of the soldier or waler members
4. The distance from the top of the form to the nearest tie rod must be a maximum of 650 mm
5. The design of the above forms are NOT suitable for:
 - Grout injected concrete
 - Concrete pumped from below
 - Deep vibration of concrete
 - External concrete vibration
