SMARTFRAME[®]
BY TILLING

SmartLVL® 15 Design Guide

Scope of this publication

This Design Guide and Load Tables assist in the selection of SmartLVL® 15 beams for most of the common structural arrangements met in domestic construction.

Methods of developing lateral restraint and providing adequate support, adequate anchorage against wind uplift, and overall structural stability are outside the scope of this publication, however some limited examples have been reproduced within this document.

Information on the above matters can be obtained from AS 1684 Residential timber-framed construction or from a structural engineer experienced in timber construction.

Tilling Timber Pty Ltd have structural engineers at the Smart-Frame Design Centre who can be contacted for advice on matters concerning the use of its engineered timber products in timber construction at techsupport@tilling.com.au or on the Techsupport HelpLine 1300 668 690.

Substitution of other products

All load tables in this document are designed using in-grade tested properties of SmartLVL® as distributed by Tilling Timber Pty Ltd. Other manufacturers' LVL may have different properties and therefore cannot be designed using these span tables.

Copyright

Copyright of this publication remains the property of Tilling Timber Pty Ltd, and reproduction of the whole or part of this publication without written permission from Tilling Timber Pty Ltd is prohibited.

Certification

As a professional engineer, qualified and experienced in timber engineering, I certify that the use of the SmartLVL members as shown in these tables, and installed in accordance with the provisions of this Design Guide, complies to the National Construction Code (NCC). These span tables have been prepared in accordance with standard engineering principles, the relevant test reports and Australian standards, ie:

- AS 1720.3 Design criteria for timber-framed residential buildings
- AS 1720.1 Timber structures - design methods
- AS 4055 Wind loads for houses
- AS/NZS 4357 Structural laminated veneer lumber
- AS/NZS 4063 Characterisation of structural timber

1. SmartLVL® 15

Description

SmartLVL 15 is a structural Laminated Veneer Lumber (LVL) manufactured by toll manufacturers for Tilling Timber to meet the quality controlled process requirements of AS/NZS 4357 - Structural Laminated Veneer Lumber.

Sustainability

SmartLVL is manufactured from wood fibre from sustainably managed forests and is produced under a chain of custody system certified to comply with the PEFC International Standard – Chain of Custody of Forest Based Products –

Requirements (PEFC ST 2002:2103) Certificate No SCS-PEFC-COC-004061.

Quality

CMI ProdCert

Compliance with process based quality control requirements is third party audited by CMI Certification Pty Ltd, a JAS-ANZ accredited Product Certification Body and the audits, together with end product testing is used as the basis for CMI ProdCert certificates PC10101 and PC10096.

JAS-ANZ

Preservative Treatment options

Stock SmartLVL is H2s (glue line) treated for use South of the Tropic of Capricorn. It can be post- production pressure treated to H2 or H3 to AS/NZS 1604. (see page 11)

Short term water repellency

SmartLVL comes with a clear **new generation** short term water repellency H₂O Shield™ to replace the old fashioned wax sealers used by most other LVL manufacturers. H₂O Shield™ is a water-based sealer specifically formulated for SmartFrame EWP.

H₂O™ shield offers numerous key benefits:

- High-penetrating surface treatment
- Formulated to repel rain during storage and construction
- Includes a biocide/fungicide
- Paintable - acrylic and oil based coatings
- Glueable – using standard construction adhesives between the LVL and wood or plaster products
- When transporting or walking on the LVL, it does not become slippery like the wax surface coating
- Environmentally friendly

Users will notice that the new sealer absorbs into the wood instead of leaving a film on top of the surfaces, which is the key to its added benefits.

1.1 SmartLVL Design/effective span

Normal structural analysis uses the centreline representation of the member. The term “span” can be defined in a number of ways and these are defined as follows:

Clear Span. This is the distance between the faces of any support. It is generally the one easiest to measure and read from the drawings

Nominal span/centre-line span. This is the distance between the centre of the supports. This span is used to determine bending moments and deflections for continuous spanning members

Diagram (a) shows beam where bearings have been designed appropriately. The effective span is taken as the distance between the centre of each bearing area

Diagram (b) shows beam where bearings at each end have been oversized. (This is frequently the case for beams that bear onto brickwork or concrete walls where the thickness of the wall is in excess of the area required to give the beam bearing capacity).

To find the correct effective span:

- Calculate the minimum bearing required to carry the loads satisfactorily
- Add minimum bearing length to “clear span” distance.

Design span/Effective span. This is the span used for single span members to determine the bending moment, the slenderness of bending members and the deflections. In NZS 3603 this is the dimension referred to as “L”, and is defined below.

Design span/Effective span is the distance between -

- The centre of the bearing at each end of a beam where the bearing lengths have **NOT** been conservatively sized
- The centre of notional bearing that have been sized appropriately, where the size of the bearing **IS** conservative.

1.2 Continuous spans

For beams continuous over two (2) unequal spans, the design span and the "Resultant Span Description" depend upon the percentage difference between the two spans as shown below:

Note, for continuous spans, the Design Span is taken as the distance between the centre of the supports, as shown in "Design Span" on page 1 of the Design Guide.

Span Difference %	Effective span	Resultant span Description
10% max	Main span	Continuous
10 - 30%	1.1 x Main span	Continuous
above 30%	Main span	Single

$$\text{span difference} = \frac{(\text{main span} - \text{second span}) \times 100}{(\text{main span} + \text{second span})}$$

1.3 Rip sawing SmartLVL 15

One of the unique properties of Smart LVL is that it may be ripped through the depth to the smaller section sizes as those given in these span tables without affecting the basic strength properties. It is important that the new members are not cut undersized if the maximum spans in these tables are to be used.

The sawing through the thickness to produce sections of a lesser thickness may decrease the integrity of the SmartLVL and is therefore NOT recommended under any circumstances.

Joist and bearer span tables do NOT allow for the practice of notching the top of the member over a support

1.4 Multiple SmartLVL 15 section beams

Vertical laminations may be achieved by adopting the procedures described in clause 2.3 of AS1684, however these procedures should be considered as the minimum requirements to achieve the desired effect.

Experience with SmartLVL 15 beams indicates that this degree of fixing may not satisfactorily prevent cupping of individual components as a result of the ingress of moisture between laminates during construction.

The suggested methods of vertical lamination below provide a

greater level of fixity between individual components, and with the use of an elastomeric adhesive, also prevents moisture penetration between the laminates.

Maximum floor load width tables for multiple member laminations of SmartLVL 15:

1. Nail lamination
2. Type 17 screw lamination
3. Bolt lamination

are shown below

1. Nailing

Table 1

Top (symmetrically) loaded beam			
Section width	Nail type	No of nail rows (both sides)	Nail spacing (mm)
2/35	3.15 x 65	2 or 3*	300
3/35 & 2/45	3.30 x 90	2 or 3*	300
2/42	3.06 x 75	2 or 3*	200
3/42, 3/45 & 2/58 3/58, 2/65 & 3/65	Nail lamination is not suitable, requires screws or bolts		

* Beam depth $\geq$ 300 mm 3 rows of nails

1.5 On-site cutting, notching and drilling of SmartLVL beams, bearers, rafters and joists

The cutting, notching and drilling details within Fig 4.1 of AS 1684 pre-date both the introduction of LVL and the common use of roof trusses, and therefore presents deemed-to-satisfy solutions based upon the solid section timber types/sizes and systems commonly used to frame a typical Class 1 and 10a building at that time.

Contemporary open plan building styles with larger spans and deeper/thinner beams made possible by the introduction of LVL combined with the near universal practice of building with roof trusses that typically load only to external walls have now rendered some of these deemed-to-satisfy solutions non-conservative, especially in cyclonic wind loadings.

It is for this reason that it is recommended that on-site cutting, notching and drilling of SmartLVL 15 be limited to the provisions shown below.

Further information about the effects of cutting and notching of timber elements can be found in Appendix E of AS 1720.1.

1. Notching

Notching of LVL beams should be avoided whenever possible, especially on the tension side of a member. Tension-side notching of LVL beams is not recommended except at end bearings and then only under specific conditions. The notching of LVL beams on the tension side results in decreased strength caused by stress concentrations that develop around the notch and a reduction of the net cross section resisting the bending and shear forces. Such notches induce perpendicular-to-grain tensile stresses which, in conjunction with horizontal shear forces, can cause splitting along the grain, typically starting at the inside corner of the notch. Stress concentrations, due to notches, can be reduced by using a gradually tapered notch configuration in lieu of a square-cornered notch.

All onsite notches should be accurately cut. Avoid over cutting at the corners of the notch. Drilling a 16 mm ϕ pilot hole in a member at the interior corner of a notch as a stop point for the saw blade provides both a rounded corner and minimizes over cutting at the corner and reduces stress concentrations in these areas.

1.5 On-site cutting, notching and drilling of SmartLVL beams, bearers, rafters and joists (Cont'd)

Figure 1

Where LVL beams are notched at the ends for bearing over a support, the notch depth is recommended to not exceed 1/10 of the beam depth (Figure 1(e)).

f_v = shear stress (MPa)
 d = depth of LVL beam (mm)

V = shear force at notch location (kN)
 d_e = effective depth as shown (mm)

b = width of LVL beam (mm)
 e = length of notch as shown (mm)

Notching (cont'd)

For notches on the compression side, a less severe condition exists and equations for the analysis of the effects of these notches are also given in Figure 1. The equations given are empirical in nature and were developed for the conditions shown.

As the notching provisions given in this Note are limited to uniformly loaded simple span beams, the notches shown in Figure 1 occur in areas of high shear and lower moment. For this reason, the design equations given are shear equations.

When necessary to cut a small notch in the top of an LVL beam (in the compression side) to provide passage for small-diameter pipe or conduit, the cut should be made in an area of the beam stressed to less than 50% of the allowable bending stress. The net section in this area should be checked for shear and bending

stresses to ensure adequate performance.

It should be recognized that the top of an LVL beam might not always be stressed in compression and the bottom of an LVL beam might not always be stressed in tension. For example, if the LVL beam is designed for wind uplift, the top of the LVL will be stressed in tension and the bottom of the LVL will be stressed in compression.

In this case, the recommendations given above should be applied accordingly. Furthermore, when evaluating the effect of notching, the shear force within a distance from supports equal to the beam depth should not be neglected, as typically permitted by the design of rectangular wood members in accordance with the AS 1720.1.

Horizontal holes

Like notches, holes in an LVL beam reduce the net section of the beam at the hole location and introduce stress concentrations. This causes a reduction in the beam capacity. For this reason, horizontal holes in LVL are limited in size and location to maintain the structural integrity of the beam. Figure 2 shows the zones of a uniformly loaded beam in simple or multiple spans, where the onsite drilling of holes may be considered. The requirements given

consider the effect of the horizontal hole on the shear and moment capacities of an LVL beam, and may be applied to multiple-piece built-up LVL beams.

Where larger horizontal holes than those specified in this document cannot be avoided in design, in some circumstances larger penetrations may be specifically designed by a structural engineer experienced in timber engineering.

Figure 2

Permissible horizontal round hole locations for LVL beams under uniform loads

A 25 mm $\varnothing$ or smaller hole may be cut at the middle $\frac{1}{3}$ of the beam depth anywhere along the span, except for the area that is within 150 mm of clear distance between the face of the support and the nearest edge of the hole (see Figure 3 on next page), provided the following conditions are all met:

1. The beam is at least 190 mm in depth
2. The beam is subject to uniform loads only

3. The span-to-depth ratio (l/d) is at least 11
4. The maximum number of holes for each span is limited to three
5. The horizontal spacing must be a minimum of two diameters clear distance between adjacent holes based on the diameter of the larger hole
6. The hole must not be cut in cantilevers.

Figure 3

Zones where a 25 mm or smaller diameter horizontal holes are permitted in a uniformly loaded LVL beam of depth ≥ 190 mm

1.5 On-site cutting, notching and drilling of SmartLVL beams, bearers, rafters and joists (Cont'd)

Horizontal holes (Cont'd)

Beam depth (mm)	Span when L/d = 11 (mm)
200	2200
240	2640
300	3300
360	3960
400	4400
450	4950
525	5775
600	6600

The L/d of 11, is the span to depth ratio that segments the expected failure modes between shear and bending. When $L/d < 11$, the span is short, and it is expected that shear strength rather than bending will govern.

Onsite-drilled horizontal holes should be used for access only and should not be used as

attachment points for brackets or other load bearing hardware unless specifically designed as such by an engineer. Examples of access holes include those used for the passage of wires, electrical conduit, small-diameter sprinkler pipes, fibre-optic cables and other small, lightweight materials.

For LVL beams that have been over-sized, the guidelines given above may be relaxed based on an engineering analysis. When holes are required to be drilled outside the allowable zones, an engineering analysis should be conducted and approved by a structural engineer experienced in timber engineering.

Regardless of the hole location, holes drilled horizontally through a member should be positioned and sized with the understanding that the beam will deflect (creep) more over a period of time under in-service loading conditions. This deflection could overstress supported equipment or piping unless properly considered.

Vertical holes

Whenever possible, avoid drilling vertical holes through LVL beams unless the beam width is at least 58 mm. For SmartLVL elements ≤ 58 mm thick, a 450 mm long cleat should be added as shown below, to avoid drilling vertical hole through thinner member.

Use a drill guide to minimize "wandering" of the bit to ensure a true alignment of the hole through the depth of the beam. The vertical hole should be centred in the beam width.

Nails/screws/bolts	Design Capacity
6 off 3.75 ϕ nails each side with min 40 mm penetration into adjacent joist/cleat	20 kN Wind uplift
6 off No 12 Type 17 screws with min 40 mm penetration into joist	
5 off No 14 Type 17 screws with min 45 mm into joist	
3 off M10 bolts	

As a rule of thumb, vertical holes drilled through the depth of an LVL beam cause a reduction in the capacity at that location directly proportional to the ratio of $1\frac{1}{2}$ times the diameter of the hole to the width of the beam. For example, a 12 mm hole drilled in a 58 mm wide LVL beam would reduce the beam capacity at that section by approximately $(12 \times 1.5)/58 = 31\%$

Holes for support of suspended equipment

Heavy equipment or piping suspended from LVL beams should be attached such that the load is applied to the top of the beam to avoid inducing tension perpendicular-to-grain stresses.

Any horizontal holes required for support of significant weight, such as suspended heating and cooling units or main water lines, should be located above the neutral axis of the beam and in a zone stressed to less than 50% of the allowable bending stress. The beam capacity should be checked for all such loads to ensure proper performance.

Protection of onsite-cut notches and holes

Frequently, LVL beams are provided by the manufacturer with the ends sealed by a protective coating. This sealer is applied to the end grain of the LVL to retard the migration of moisture in and out of the beam ends during transit and job site storage. Onsite cutting a notch at the end of a beam can change the moisture absorption characteristics of LVL at the notch location. This can result in localized splitting at the corners of the notch. To minimize this possibility, all notches should be sealed with a water-repellent sealer immediately after cutting. Sealing other onsite cuts as well as onsite-drilled holes is also recommended. These sealers can be applied with a brush, swab, roller or spray gun.

Further Information

Further information about the provision of larger holes, or advice about dealing with holes that have been cut into the LVL that are outside these guideline can be obtained by contacting the techsupport helpline on 1300 668 690 or at techsupport@tilling.com.au.

1.6 Steel and timber post fixing to SmartLVL

1.7 Fire resistance

The Fire Resistance Level (FRL) is the performance criteria for fire resistance, i.e. the grading periods (in minutes) for the following criteria as specified in the BCA:

- Structural adequacy: (the duration for which the elements can carry its designated load)
- Integrity: (the duration for which the element can maintain its integrity to prevent the spread of fire to/from the compartment)

and

- Insulation: (the duration for which the element is insulating the adjacent space from excessive temperature rise)

and is expressed in that order e.g. 30/30/30. The method for determining the structural component of the Fire Resistance Period for timber (including LVL and Glulam) is described in AS / NZS 1720.4 - 2019 Timber Structures Part 4: Fire resistance of timber elements.

$$c = 0.4 + \left(\frac{280}{\delta} \right)^2$$

Equation 2.5.2

where:

Floor joists parallel to the wall

CB2

Additional 45/58 mm SmartLVL blocking. Timber blocks shall be arranged to be continuous. Where they are joined, joins must occur at a location of a stud or block directly behind the joint

Floor joists perpendicular to the wall

CB1

Additional 45/58 mm SmartLVL blocking. Timber blocks shall be arranged so that they are continuous. Where they are joined, joins must occur at a location where stud or block is directly behind the joint

1.8 Roof construction detailing

R16

DO NOT cut the birdsmouth in the direction of the SmartLVL veneers

R15

Rafters are NOT to be skew nailed to the underpurlin with the nails parallel to the direction of the veneers

Rafter underpurlin fixing

Vertical SmartLVL roof struts

1.9 Lateral restraint of Hanging, Counter, Strutting, Strutting/hanging beams, Strutting/counter beams

(a) Block skew nailed to beam and to support with 3/75 mm skew nails to each member.
(b) Min 35 x 32 mm tie nailed to top of beam and to support with 2/75 mm nails at each end.
(c) Galvanised strap nailed to support and top of beam with 2/30 x 2.8 ϕ mm nails each end and to beam.

Notes:

- 1. Method used depends upon whether ceiling joists are perpendicular or parallel to the beam
- 2. Methods given in (b) and (c) are particularly suitable for restraining strutting beams and strutting/hanging beams at the intermediate points where the beams are supported, as they also permit these beams to be supported up clear of the ceiling joists by packing under at their supports.

Example intermediate lateral restraints

1.10 Chemical resistance

SmartLVL (wood in general) has a definite advantage over steel members when exposed to corrosive environments. Timber and wood products are able to withstand mild acid conditions and are more resistant to degradation.

The behaviour of SmartLVL in chemical environments depends upon a number of factors, including PH and temperature. Wood essentially responds by either swelling (Category S), similar to moisture response, or by chemical degradation (Category D). Damage due to swelling is essentially reversible, but chemical degradation results in breakdown of the wood structure and is non-reversible. Category S agents include alcohol and other polar agents. These agents swell dry wood causing a strength (and stiffness) loss proportional to the swelling.

Category D agents include acids, alkalis and salts and result in a loss of strength and stiffness directly related to the loss of member cross-section. The table below provides a rough guide to performance of SmartLVL in chemical environments.

The effect of chemicals on wood will generally be worsened by increased exposure time, temperature, extremes of pH and chemical concentration. Wood generally offers considerably less resistance to alkalis than acids. Softwoods (includes SmartLVL) generally have better resistance to acids than hardwoods.

Where there is the possibility of chemical attack on SmartLVL members, designers should seek expert advice.

Agent category	Chemical agent	Mode of attack	Damage - reversible or permanent	Severity - (loss of strength and/or stiffness)
Neutral	Non-polar liquids such as petroleum hydrocarbons	None	Negligible	Negligible
S (swelling)	Alcohol and other polar solvents	Swelling	Reversible	Proportional to volumetric swelling
D (degrading)	Inorganic acids	Hydrolysis of cellulose	Permanent	Slight to moderate
D	Organic acids such as: Formic, acetic, propionic and lactic acid	Hydrolysis of cellulose	Permanent	Slight (pH 3-6)
D	Alkalis such as: sodium, calcium and magnesium hydroxide	De-lignification of wood and dissolving of hemicellulose	Permanent	Moderate (pH > 9.5) Severe (pH > 11)
D	Salts (considered as weak acids)	Hydrolysis of cellulose	Permanent	Slight

Timber equilibrium moisture content (EMC) zones in Australia

Climate description (engineering interpretation)

Term	Meaning for timber	Term	Meaning for timber
Arid	Very low EMC, minimal shrink/swell	Humid coastal	High EMC, low seasonal variation
Semi-arid maritime	Moderated, but still relatively dry	Tropical	High EMC, wet-season driven
Mediterranean	Large seasonal swing	Temperate	Moderate-high EMC, winter dominant

Predicted EMC range of timber for sheltered outdoor conditions by City

1.11 Durability and exposure to moisture

1.11.1 Basis of EMC zone maps

Timber is a hygroscopic material that exchanges moisture with surrounding air until an equilibrium condition is reached. This equilibrium moisture content (EMC) depends primarily on the relative humidity (RH) and temperature of the surrounding environment.

The city-based EMC table has been developed using the CSIRO dataset “Moisture Content Predictions for Eight Seasoned Timbers under Sheltered Outdoor Conditions in Australia and New Guinea” (Finighan, 1966), which provides predicted monthly timber moisture contents for a wide range of Australian localities.

In that study, timber specimens of multiple species and thicknesses were exposed under sheltered outdoor conditions, and their moisture contents were correlated with long-term meteorological data, primarily dry-bulb temperature and relative humidity using regression equations.

The resulting tables present monthly mean moisture contents representative of typical in-service conditions for protected structural timber.

For each city, January and July EMC ranges were derived to capture seasonal variation, recognising that Australia exhibits two distinct moisture regimes: a monsoonal pattern in the north where summer (wet season) EMC exceeds winter values, and a temperate pattern in the south where winter EMC is higher due to increased relative humidity. The ranges presented are not single-point estimates but envelopes that account for inter-species variation, short-term climatic fluctuation, and the statistical spread inherent in the CSIRO regression models.

This approach aligns with the original study, which demonstrated that predicted moisture contents typically fall within a narrow band (generally within $\pm 1\text{--}2\%$) of observed values under comparable conditions.

Finally, an annual EMC band has been assigned to each location, representing the practical range between seasonal minima and maxima. These bands are intended for design application, such as assessing timber shrinkage, serviceability, and durability risk. The associated climate descriptions further group cities into coherent moisture regimes, enabling designers to extrapolate beyond individual locations and apply EMC assumptions at a regional scale.

1.11.2 LVL Durability and exposure to moisture

SmartLVL is manufactured from softwood veneers which have a durability rating of class 4, which is the same rating as some Ash type Eucalypts.

Definitions of exposure zones within a structure

External timbers are regarded as protected in AS 1684 if they are covered by a roof projection (or similar) at 30° to the vertical and they are well detailed and maintained (painted and kept well ventilated).

Untreated SmartLVL should not be used where the equilibrium moisture content is likely to remain above 20% for an extended

period.

Untreated and H2s SmartLVL is suitable in the *internal, fully protected, ventilated* and the *external above ground, protected* zones of the structure as shown below. Untreated or H2s SmartLVL is not suitable for *external above ground, exposed* or humid indoor conditions, such as swimming pool enclosures.

SmartLVL, like all wood products, is hygroscopic, which means it has an affinity for water, and being a LVL, should be considered as a composite of many pieces of wood, each with different potential swelling. Moisture exposure will ultimately lead to dimensional change.

SmartLVL is supplied WITH a new generation short term construction water repellent (H₂O Shield™) and once framed into a structure may be exposed to the weather for a limited time (usually not greater than 3 months) without negative affect, BUT, it may exhibit some effects of this exposure such as swelling and checking (especially at cut ends), depending upon the weather conditions.

While offering significant water short term repellency comparable to wax coatings, the H₂O Shield™ does NOT totally WATER PROOF the LVL. While the products will withstand normal exposure, excessive exposure during distribution, storage or construction may lead to dimensional changes that affect serviceability. These changes include cupping, bowing or expansion to dimensions to beyond the specified tolerance of the product in the “as-manufactured” condition.

Individual members of a vertically laminated multi member may exhibit some cupping if water becomes trapped between the laminates. This cupping produces more of a visual and possible fixity problem rather than being structurally significant. If not properly dried out, this moisture between laminated members may lead to decay. To prevent this effect, use construction details as shown on page 2.

As an organic material, mould and mildew may grow on untreated wood products if moisture is present. Prolonged periods of high moisture may also support the growth of wood decay fungi. The H₂O Shield™ does provide some resistance to mould and fungi attack, but it is NOT equivalent to H3 treatment.

In critical applications where dimensional change due to moisture exposure is to be absolutely minimised (e.g. truss applications in wet humid conditions) it is recommended that the remedial H₂O shield available from Tilling Timber in spray cans (or bulk for airless spray guns) be used to recoat any cut ends or notches etc.

The table below shows the moisture content of LVL as a function of humidity.

Moisture content of wood products % ⁽¹⁾	
Relative Humidity %	LVL MC
10	1.2
20	2.8
30	4.6
40	5.8
50	7.0
60	8.4
70	11.1
80	15.3
90	19.4

1. Approx. moisture content at 21°C

1.11.3 Dimensional Change

SmartLVL will shrink and swell in proportion to the moisture content between 0 and 28% fibre saturation point.

1.11 Durability and exposure to moisture

The most significant moisture movement will occur across the grain (tangential and radial directions within a log). Longitudinal (movement in the grain direction) may be a factor depending upon the type of structure. Detailing of SmartLVL to be used where moisture contents will cycle should allow for dimensional instability.

The AVERAGE amount of dimensional change in a piece of LVL changes in moisture content can be APPROXIMATED by the following formula:

$$\Delta D = D_i S (MC_i - MC_f) / FSP$$

Where:

ΔD = change in dimension
 D_i = Initial dimension
 S = Shrinkage coefficient = approximately 6%
 MC_i = Initial moisture content
 MC_f = final moisture content
 FSP = fibre saturation point approximately 28%

HOWEVER, these dimensional effects are quite variable. Thickness swell in LVL is erratic along the length because of the densification of the lap joints during manufacture tends to “relieve” when saturated and the total swell in sections containing two (2) laps can be as much as 3 mm.

Worked example

Estimating timber movement from EMC change

If a 300 × 63 LVL13 roof beam that is at equilibrium in Perth is instead used in Broome in January, how much increase in depth and width could be expected?

Step 1 — EMC difference

Use the midpoint of the two EMC bands:

- Perth January EMC ≈ 10 %
- Broome January EMC ≈ 12. %

So:

$$\Delta MC = 12 - 10 = 2.0\%$$

That means the LVL would be expected to gain moisture and therefore swell slightly in Broome relative to Perth.

Step 2 — Movement formula

Use:

$$\Delta d = d \times 0.0027 \times \Delta MC$$

where d is the relevant cross-sectional dimension in mm.

Step 3 — Change in depth

For the 300 mm depth:

$$\Delta d = 300 \times 0.0027 \times 2.0 = 1.62 \text{ mm}$$

Expected increase in depth ≈ 1.6 mm

Step 4 — Change in width

For the 63 mm width:

$$\Delta b = 63 \times 0.0027 \times 2.0 = 0.34 \text{ mm}$$

Expected increase in width ≈ 0.3 mm

For a 300 × 63 LVL13 roof beam moving from Perth January conditions to Broome January conditions, a reasonable worked-example estimate is:

- Depth increase: about 1.6 mm

- Width increase: about 0.3 mm

Because the EMC values are bands, there is a reasonable range around that midpoint result:

- If the EMC difference were only 1%, the beam would increase by about 0.8 mm in depth and 0.2 mm in width
- If the EMC difference were 3%, the beam would increase by about 2.4 mm in depth and 0.5 mm in width

1.11.4 Change in characteristic strengths

Changes in moisture content in wood results in changes in mechanical properties, with higher properties at lower moisture contents. Estimates of the effect of moisture differentials on the properties of clear wood may be obtained by the following equation:

$$P = P_{12} \left(\frac{P_{12}}{P_g} \right)^{\left(\frac{12 - M}{M_p - 12} \right)}$$

Where:

P = Characteristic property at moisture content
 P_{12} = same Characteristic property at 12% moisture content
 P_g = same Characteristic property for Green wood
 M_p = Intersection moisture content = 24%

APPROXIMATE affect upon key characteristic design properties of LVL by changes in MC are outlined in the table below:

Characteristic Property		% Reduction in Characteristic strength at % MC					
		14	16	18	20	22	24
MOE (Stiffness)	E	3.3	6.5	9.7	12.7	15.6	18.4
MOR (Bending)	F _b	8.4	16.1	23.1	29.6	35.5	40.9
Compression perpendicular to grain	f _p	9.9	18.9	27.0	34.2	40.8	46.7
Compression parallel to grain	f _c	11.0	20.7	29.4	37.2	44.1	50.2
Shear	f _s	6.6	12.8	18.6	24.0	29.0	33.7

The design Characteristic properties of SmartLVL can therefore be considerably reduced by severe increase in MC of the LVL.

If the SmartLVL is being built into structures (such as Prefabricated trusses) that are:

1. Likely to experience large increase in MC due to weather exposure or stored on the ground
2. Likely to be loaded to at/or close to design loads while in the high MC state

then the reduced Characteristic Strengths as detailed above NEED to be used in the design or members may require temporary propping.

Once covered, the SmartLVL will ultimately dry and re-equilibrate to the ambient humidity conditions, but some expansion or swelling will remain after re-drying. The thickness swelling in laps will never fully shrink back and a large piece of LVL can have a final thickness variation along the length of 3-4 mm.

Estimating timber deflection change from EMC change

For a 300 × 63 timber member designed in Perth to have a long-term deflection of 10 mm under $G=0.4$ and $Q=1.5$, with $j_2=2$,

1.11 Durability and exposure to moisture

corresponding member in Broome may be expected to deflect about 11.0 mm under the same loading.

Worked example:

Summary- In this worked estimate, the increase arises from two sources: a small increase in immediate elastic deflection due to reduced stiffness at higher service moisture content, and a larger increase in the mechano-sorptive / creep component associated with the wetter Broome service environment.

The net increase is about 0.95 mm, or about 10%.

Step 1 — Back-calculate the Perth load-deflection constant

Item	Perth	Broome	Comment
Member size	300 × 63	300 × 63	Same section
Permanent action, G	0.4	0.4	Same load
Imposed action, Q	1.5	1.5	Same load
Adopted creep factor j_2	2.0	2.35	Broome increased for higher EMC
Representative service EMC	11.5%	13.5%	From the Perth/Broome climate bands previously derived
Relative stiffness factor	1.00	0.96	Assumed 4% lower E in Broome
Assumed long-term Deflection (mm)	10.00	—	

Given:

$$10 = k[Q + (1 + j_2)G]$$

$$10 = k[1.5 + (1 + 2) \times 0.4]$$

$$10 = k(2.7)$$

$$k = 3.7037 \text{ mm per load unit}$$

Step 2 — Split the Perth deflection into elastic and mechano-sorptive parts

Perth component	Calculation	Deflection
Immediate dead-load deflection	0.4×3.7037	1.48 mm
Immediate live-load deflection	1.5×3.7037	5.56 mm
Total immediate elastic deflection	$1.48 + 5.56$	7.04 mm
Mechano-sorptive / creep increment	$j_2 \times \Delta G_{inst} = 2 \times 1.48$	2.96 mm
Total long-term deflection	$7.04 + 2.96$	10.00 mm

Step 3 — Adjust the elastic part for Broome

Assume Broome service EMC is about 2 percentage points higher, giving a 4% reduction in stiffness:

$$E_{Broome} = 0.96 \times E_{Perth}$$

So deflection increases by:

$$1/0.96 = 1.0417$$

Broome elastic component	Calculation	Deflection
Immediate dead-load deflection	1.48×1.0417	1.54 mm
Immediate live-load deflection	5.56×1.0417	5.79 mm
Total immediate elastic deflection	7.04×1.0417	7.33 mm

Step 4 — Adjust the mechano-sorptive part for Broome

Using the EMC ratio:

$$13.5/11.5 = 1.174$$

$$j_{2, Broome} = 2.0 \times 1.174 \approx 2.35$$

Then:

$$\Delta_{ms, Broome} = 2.35 \times 1.54 = 3.62 \text{ mm}$$

Step 5 — Total Broome long-term deflection

Broome total	Calculation	Deflection
Immediate elastic	—	7.33 mm
Mechano-sorptive / creep increment	—	3.62 mm
Total long-term deflection	$7.33 + 3.62$	10.95 mm

Note: These example are illustrative only.

The assumed relationship between EMC, dimensional change, stiffness reduction and creep / mechano-sorptive behaviour is simplified for worked-example purposes and should not be taken as a product-specific design rule.

Actual values may vary with species, product type, load duration, moisture cycling amplitude, and service exposure.

1.11.5 Design for durability

- The use of building overhangs and other structures which protect the beams from excessive moisture movement and sun exposure.
- All beams should be provided with adequate ventilation so that moisture content within beams will not exceed 15% and moisture gradients across the beam will not occur.
- The use of arrised or round edges on beams to reduce the likelihood of coating failures on sharp edges.
- The use of drip edges or other devices which provide a path for free moisture flow away from the timber beam.
- Joint detailing should, wherever possible, comply with the following:
 - Keep horizontal contact areas to a minimum, in favour of self draining vertical surfaces.
 - Ventilate joint surfaces by using spacers, wherever possible
 - Always use compatible fasteners which have adequate corrosion protection and do not cause splitting during installation e.g. hot dipped galvanic coatings or stainless steel
 - Ensure any moisture entering a joint is not trapped but can adequately drain away from the joint.

Allow for thermal expansion/contraction in the joint design.

1.11.6 Post-Production treatment

SmartLVL is supplied glue-line H2S* treated or can be supplied either LOSP treated or Tru-Core® treated to either H2 or H3 hazard class levels, as per AS/NZS 1604.4. (Tru-Core® is a registered trade mark of Kop-Coat Australia PTY Limited)

To maintain effective treatment it is a requirement that any cuts, notches or penetrations made in post production treated LVL be painted with a suitable "brush/spray on" preservative.

The hazard class number selected is based upon the specific exposure condition for the proposed end use of the SmartLVL, as shown in the table on the next page.

1.11 Durability and exposure to moisture (Cont'd)

Hazard class selection guide				
Hazard class	Exposure	Specific service conditions	Biological hazard	Typical uses
H1 [†]	Inside, above ground	Completely protected from the weather and well ventilated, and protected from termites	Lyctid borers	Interior beams, staircases, stringers
H2S*	Inside, above ground	Protected from wetting Nil leaching	Borers and termites	Interior beams, staircases, trusses, joists
H2	Inside, above ground	Protected from wetting Nil leaching	Borers and termites	Interior beams, staircases, trusses, joists
H3	External, above ground	Subject to periodic moderate wetting and leaching	Moderate decay, borers and termites	Exterior beams ⁽¹⁾

[†] The timber species in SmartLVL are not susceptible to Lyctid Borer attack

* H2S treatment is only suitable South of the Tropic of Capricorn

A more comprehensive Hazard Class Table is available in AS/NZS 1604.4, but it is NOT recommended that SmartLVL be used in end uses with exposures requiring treatment in excess of H3.

Experience is showing that post production treated LVL in the **external above ground, exposed** (H3 Hazard Class) may experience some leaching of the active ingredients of the treatment. To minimise the possibility of timber degradation in these situations, it is recommended that H3 treated Smart LVL NOT be used where the surface is horizontally exposed AND unprotected from water entrapment OR where post-treatment protection cannot be maintained.

Post treatment protection may include:

- I. Protectadeck or Vapour Seal high density water proof joist/ bearer cover or malthoid capping
- and
- I. An impervious membrane such as regularly maintained painting or staining
- II. Construction detailing to prevent water entrapment.

H3 treated SmartLVL is NOT recommended for fascia's, pergolas or other similar external above ground, exposed applications due to mechanical degradation of the wood fibre causing checking and cracking which is both aesthetically unacceptable and allows ingress of water to inner veneers.

1.11.7 Fasteners for H3 LVL

For any H3 Smart LVL to be used in exposed exterior applications, it is recommended that either hot dipped galvanised or stainless steel fasteners are used.

Specifically, If the Tru-Core® Copper Quat H3 treatment process is used, high grades (304, 305 and 316) of stainless steel materials perform the best.

1.11.8 Painting of treated SmartLVL

General

To provide the longest service life of the SmartLVL it is recommended the LVL is painted with an exterior paint with a Light Reflectance Value (LRV) greater than 30%. Heat reduction exterior paints should be used where the desired colour is dark or has a LRV of less than 30% The heat reflective paint's colours should be

limited to a Total Solar Reflectance (TSR) value greater than 29%.

Any paint or stain must be recommended by the manufacturer as being suitable for the proposed application and must be applied in a manner in strict compliance to the manufacturer's recommendations.

LOSP Treated

Wait until excess solvents have evaporated and timber is dry. The pressure of the solvent (white spirits) from the LOSP treatment may affect the drying and hardening of paints if there has been insufficient evaporation time after the treatment. It is strongly recommended that the treated timber is left to recondition for at least 7 days in the end use situation before painting.

One coat of premium quality primer as a minimum should be applied to all surfaces prior to erection of beam and to any cuts or holes drilled. If the first coat of primer, sealant paint or stain fails to dry or adhere within the time expected, do not proceed to any further coats until the first coat has achieved satisfactory dryness and adhesion. If the first coat fails to dry it may be necessary to strip back to bare timber and allow it to weather for another week or two.

a. Paint

Exterior solid colour acrylic finish. One coat of oil based primer followed by one or two coats of the exterior acrylic finish as required.

or

Exterior solid colour oil based enamel. One coat of oil based primer followed by one coat of oil based under-coat (if required) then two coats of the oil based enamel.

b. Stains

Exterior semi-transparent or solid colour penetrating oil based stain or similar. Two or three coats of the stain as required or recommended by the manufacturer.

Water based stains and un-pigmented sealants, oil or water repellents are NOT recommended.

Tru-Core® Treated

1. The wood must be dry and clean prior to applying any finish coating. If initial cleaning of the treated wood is needed, it is recommended that the project be cleaned with a deck cleaning product and allow to fully dry.
2. At this time, a clear water repellent may be added to the project. If applied, allow 8 weeks prior to the application of a semi-transparent stain or paint
3. If no water repellent is added, an oil based stain can be applied to the clean, dry wood in 30-60 days from treatment date. A water based stain can be applied to the clean, dry wood in 45-70 days from treatment date.
4. Depending on the treatment method used, if the wood is left uncoated and without UV protection:
 - I. The typical brown colour of the Copper Quat treated wood will naturally weather to a grey colour over long-term exposure to the sun
 - II. The Azole treated wood has no colouration so it will naturally weather to a grey colour over long-term exposure to the sun.

Users must always conduct their own tests on coatings in inconspicuous areas of the project to determine acceptability of colour, adhesion and appearance.

1.11 Durability and exposure to moisture (Cont'd)

1.11.9 H3 Deck bearers and joists

H3 Treated Deck joists and bearers are a common application for treated SmartLVL. The diagram demonstrates the minimum construction detailing for H3 treated joists and bearers. Failure to follow these guidelines may render treatment warranties void.

It is recommended that deck nails be slightly skewed as per the detail adjacent

Note: Impervious membrane images above are examples of commercial products available only. It is the responsibility of the builder to source and install a waterproof membrane that will prevent water ponding on top of any H3 SmartLVL deck joists or bearers.

1.12 Deck ledger attachments

As with window and door installations in walls, paying careful attention to flashing details for decks attached to the house exterior is critical to avoid potential rot and mould of inner non treated wall frames and floor systems. Water from direct rain-fall, splash from decks and runoff from incorrectly sloped deck surfaces can leak into the exterior wall where the deck attaches to the house.

Several conditions contribute to the water problem:

- The ledger board is simply attached to the house with numerous lag screws or other hardware that penetrate the wall's cladding and drainage plane, but no flashing

has been installed to protect these areas

- Water is often trapped behind the ledger board
- Upward splashing of rain from the deck adds significant wetting to the cladding, and inadequate flashing results in wetting and rot in the wall's framing and other internal elements.
- Integrating the attachment of the ledger board with the drainage plane behind the wall's cladding and adding proper flashing will maintain the integrity of the drainage plane and channel water away from the wall's surface.

Example flashing of deck ledger connection to un-treated house frame

F35B

1.13 Designing with SmartLVL 15

The design information contained within this Design Guide is for the properties of SmartLVL 15 only. Other manufacturers' LVL may have different properties and therefore cannot be designed using this information.

1. Product Specification

Veneer:	Thickness:	1.9-3.0 mm
	Species:	Mixed species, Masson pine, Eucalyptus, Spruce
	Strength Group	SD6
	Joints:	Scarf joint
Dimensional tolerances:	Length:	± 10 mm
	Depth:	≤ 400 mm +2, -3 mm ≥ 400 mm +5, -0 mm
	Thickness:	- 0, +4 mm at 12% moisture content
Adhesive:	Complies with AS/NZS 4364:2010	
Treatment options:	Manufactured as H2S, H2 and H3 available on request	

2. Limit State design characteristic properties

Timber Strength Properties: ⁽¹⁾		
Bending	f'_b	65 MPa
Tension Parallel to grain	f'_t	27 MPa
Tension Perpendicular to grain	f'_{tp}	0.5 MPa
Compression Parallel to grain	f'_c	47 MPa
Compression Perpendicular to grain - Edge	f'_p	13 MPa
Shear	f'_s	5.0 MPa
Average Elastic Modulus	E	15,300 MPa
Average Modulus of Rigidity	G	765 MPa
Average Density		680 kg/m ³
Moisture Content		12-15%

(1) Dry conditions

3. Strength reduction factor

The strength reduction factor for calculating the design capacities of structural members shall be taken from the table below, referenced from AS 1720.1 –2010.

Application of SmartLVL 15 as a structural member		
Category 1	Category 2	Category 3
Structural members for houses for which failure would be unlikely to affect an area greater than 25 m ² ; OR secondary members in structures other than houses	Primary structural members in structures other than houses; OR elements in houses for which failure would be likely to affect an area* greater than 25 m ²	Primary structural members in structures intended to fulfil essential services or post disaster function
Strength reduction factor ϕ^*		
0.95	0.85	0.75

* AS 1720.1:2010 Table 2.1

4. Duration of load

The duration of load factor k_1 for strength and j_2 for creep deformation are defined within clause 2.4 of AS 1720.1.

5. Partial seasoning factor

SmartLVL 15 is a seasoned timber product, generally k_4 equals 1. Where the LVL is subjected to conditions in which the average moisture content for a 12 month period is expected to exceed 15%, the characteristic capacity shall be decreased. The value of k_4 shall be the greater of:

- $k_4 = 1 - 0.3 \frac{EMC - 15}{10}$;
- $k_4 = 0.7$

Where EMC is the highest value of the annual moisture content (percent) that the timber will attain in service.

6. Length and position of bearing

The k_7 bearing factor is defined is clause 2.4.4 of AS 1720.1

7. Load sharing

Because of the reduced variability of strength values of LVL compared to solid timber, the load sharing factor $k_9 = 1.0$ as defined in clause 7.4.3 of AS 1720.1.

8. Stability

The stability factor k_{12} is defined within section 7 of AS 1720.1 beams. The methods for calculating k_{12} for solid wood in section 3 of AS 1720.1 shall generally apply except that the material constant (ρ_b or ρ_c) for beams and column shall be as given in Tables 7.2(A) and 7.2(B)

9. Temperature

For covered timber structures under ambient conditions, no modification for strength need be made for the effect of temperature (i.e., k_3 equals 1.0) except that where seasoned timber is used in structures erected in coastal regions of Queensland north of latitude 25°S, and all other regions of Australia north of latitude 16°S, the strength shall be modified by a factor k_6 of 0.9.

1.14 Storage and handling of SmartLVL

- Store SmartLVL flat on a hard, dry surface
- If surface isn't paved, the ground should be covered with a polythene film
- Keep covered with waterproof material that allows bundles to "breathe"
- Use bearers (bolsters) between the ground and the first bundle (4 metre max spacing)
- Use 100 x 50 timber flat between bundles at same spacing as bolsters
- Take great care to rewrap remaining material after opening bundles
- LVL "grows" in thickness and depth when allowed to get wet....KEEP DRY!
- LVL with high MC has short term reduction in Characteristic Strengths KEEP DRY!
- Under NO circumstances is stored SmartLVL to be in contact with the ground.

1.15 SmartLVL 15 hanger details

Given the high load carrying capacity of SmartLVL, it is essential that the connection of SmartLVL to other structural members is considered carefully, with the industry practice of simple skew or end nailing of SmartLVL not recommended for anything but the lightest loads.

The list below contains the common light to medium duty

SmartLVL framing brackets stocked by Tilling Timber.

Member connections requiring capacities greater than those listed below can be designed by your own Engineer or SmartFrame Engineers, but any non-standard connection system designed by your own engineer or SmartFrame Engineers may take some time to be fabricated.

Tilling framing bracket code	Fixing to SUPPORTING beam	Design Capacity ϕN_j (kN) $1.2G+1.5Q_f$ (DL + FLL) JD4	Fixing to SUPPORTED beam	Wind Uplift ($k_1 = 1.14$)			
				Design Capacity ϕN_j (kN) $1.2G+1.5Q_f$ (DL + RLL) for Joint group

[‡] in each face of joist hanger

Notes:

- For this table, SmartLVL has been given a uniform JD4 Joint Strength Group. For more detailed calculations of joint strength group in particular planes contact the Techsupport Helpline on 1300 668 690
- The above tabulated capacities are for a minimum beam thickness of 35 mm
- Wind uplift capacities apply to designs in accordance with AS/NZS 1170:2002
- SLF Framing Bracket capacity has been limited to 15.0 kN shown *
- These capacities apply directly for joints in houses and on secondary beams in other structures. For joints on primary beams in structures other than houses, reduce the capacity by $0.85/0.95 = 0.89$
- Multiple laminated supporting beams - fasteners with longer lengths are required when Joist Hangers are fixed into a multiple laminated supporting beam. For double laminates, use 65 long nails or screws. Alternatively, for double or triple laminated supporting beams, additional fixings may be provided at hanger locations to laminate plies. Seek advice from the Engineer.

Floor joists supporting floor loads only

Floor mass - 40 kg/m²

EXAMPLE:

domestic floor loads
single span
joist spacing = 450 mm
joist span = 3500 mm

Enter single span table at 450 mm in joist spacing column, read down to a span equal to or greater than 3500 mm

ADOPT:

SmartLVL 15 - 170x42

Loadings: permanent - self weight + 40 kg/m² + 0.5 kPa of the live load, live load - 1.5 kPa or floor point load of 1.8 kN

525x75	10500	9900	9900	9400	12000	10400	10000	9900

NOTES:

- Spans are suitable for solid timber, particle board and ply flooring. floor sheeting glued and nailed to joists will improve floor rigidity. Where heavy overlay material is to be applied, such as a mortar bed tiled or slate floor, the permanent load allowance should be increased to 1.2 kPa. A reduction of joist spacing may be used to accommodate this extra permanent load. A satisfactory result can be achieved by adopting the maximum spans for 600 mm and 450 mm spacing but installing the joists at 450 and 300 mm spacing respectively
- For beams which are continuous over two unequal spans, the design span and the 'resultant span description' depend upon the percentage span differences between the two spans as shown on page 2
- D = member depth, B = member breadth, NS = not suitable.
- End bearing lengths = 42 mm at end supports and 58 mm at internal supports for continuous members
- Not all sizes of SmartLVL in this table are stocked in each state. Please check with your supplier before ordering .

Single span floor bearers supporting floor loads only

Floor mass - 40 kg/m²

EXAMPLE:

single span bearer = 4000 mm
floor load width = 6000 mm

Enter single span table at 6000 mm in floor load width column, read down to a span equal to or greater than 4000 mm

ADOPT:

SmartLVL 15 - 2/360 x 42

Loadings: permanent - self weight + 40 kg/m² +0.5 kPa of the live load, live load - 1.5 kPa or floor point load of 1.8 kN

NOTES:

1. D = member depth, B = member breadth, NS = not suitable.
2. The above table was based on a maximum DL of 40 (kg/m²) + 0.5 kPa of LL, floor live load of 1.5 (kPa), floor point load of 1.8 (kN)
3. End bearing lengths = 42 mm at end supports and 58 mm at internal supports for continuous members. Subscript values indicate the minimum additional bearing length where required to be greater than 42 mm at end supports and 58 mm at internal supports
4. Restraint value for slenderness calculations is 600 mm (floor joist centres at 600 mm max)
5. Not all sizes of SmartLVL in this table are stocked in each state. Please check with your supplier before ordering

Floor bearers supporting single storey load bearing wall - sheet and tiled roof

Floor mass - 40 kg/m²

EXAMPLE:

sheet roof - 40 kg/m²
 roof load width = 1950 mm
 bearer span = 3000 mm (single span)
 floor load width = 2200 mm

Enter single span table at 2400 mm in floor load width column, 4500 roof load width column, read down to a span equal to or greater than 3000 mm in the 40 kg/m² row.

ADOPT:

SmartLVL 15—2/240x42

NOTES:

1. D = member depth, B = member breadth, NS = not suitable.
2. The above table was based on total ground floor mass of 40 kg/m² + 0.5 kPa of LL, wall mass of 37 kg/m², floor live load of 1.5 kPa, floor point load of 1.8 kN
3. The above table was based on a wall height of 2700 mm
4. End bearing lengths = 70 mm at end supports and 70 mm at internal supports for continuous members. Subscript values indicate the minimum additional bearing length where required to be greater than 70 mm at end supports and 70 mm at internal supports.
5. Restraint value for slenderness calculations is 600 mm
6. Not all sizes of SmartLVL in this table are stocked in each state. Please check with your supplier before ordering

Single span floor bearer supporting double storey load bearing wall - sheet and tile roof

EXAMPLE:

sheet roof - 40 kg/m²
 roof load width = 1950 mm
 bearer span = 3100 mm (single span)
 lower floor load width = 3500 mm
 upper floor load width = 1500 mm

Enter single span table at 3600 mm in lower floor load width column, 1800 mm in upper floor width column, 4500 mm roof load width column, read down to a span equal to or greater than 3100 mm in the 40 kg/m² row.

ADOPT:

SmartLVL 15 - 2/240x42
 (With additional bearing length of 50 mm required)

Lower floor load width (mm)		1800						3600

NOTES:

1. D = member depth, B = member breadth, NS = not suitable.
2. The above table was based on total upper floor mass of 40 kg/m², total ground floor mass of 30 kg/m², floor live load of 1.5 kPa, floor point load of 1.8 kN, wall mass of 37 kg/m², and permanent floor live load of 0.5 kPa.
3. The above table was based on a wall height of 5400 mm
4. End bearing lengths = 70 mm at end supports and 70 mm at internal supports for continuous members. Subscript values indicate the minimum additional bearing length where required to be greater than 70 mm at end supports and 70 mm at internal supports.
5. Not all sizes of SmartLVL in this table are stocked in each state. Please check with your supplier before ordering

Single span lintels in single/upper storey walls AS 4055 classification N1, N2 and N3

Single/Upper storey lintel

EXAMPLE:

wind speed = N3
sheet roof - 40 kg/m²
rafter/truss spacing = 600 mm
lintel span = 3500 mm
roof load width = 3900 mm
Enter span table at 4500 roof load width column, rafter/truss spacing 600 mm, and read down to a span equal to or greater than 3500 mm

ADOPT:

SmartLVL 1 5 - 300x42
(with additional bearing length of 5 mm required)

NOTES:

- D = member depth, B = member breadth, NS = not suitable.
- Minimum bearing length = 35 mm at end supports. Subscript values indicate the minimum additional bearing length where required to be greater than 35 mm.
- Restraint value for slenderness calculations is 600 mm.
- Not all sizes of SmartLVL in this table are stocked in each state. Please check with your supplier before ordering

Single span lintels in lower storey walls AS 4055 classification N1, N2, N3 & C1

EXAMPLE:

wind speed = N3
sheet roof - 40 kg/m²
rafter/truss spacing = 600 mm
lintel span = 3500 mm
roof load width = 3900 mm
floor load width = 1200 mm
Enter span table at 4500 roof load width column, floor load width 1200 mm, and read down to a span equal to or greater than 3500 mm

ADOPT:

SmartLVL 15 - 2/300x42

NOTES:

1. D = member depth, B = member breadth, NS = not suitable.
2. Minimum bearing length = 35 mm at end supports. Subscript values indicate the minimum additional bearing length where required to be greater than 35 mm.
3. Restraint value for slenderness calculations is 600 mm.
4. Not all sizes of SmartLVL in this table are stocked in each state. Please check with your supplier before ordering

Single/continuous span roof rafter - with ceiling attached AS 4055 classification N1, N2 and N3

EXAMPLE:

wind speed = N3
sheet roof - 40 kg/m²
rafter/truss spacing = 600 mm
rafter span = 5800 mm (single span)
Enter span table at rafter spacing of 600 mm, and read down to a span equal to or greater than 5800 mm for the 40 kg/m² row

ADOPT:

SmartLVL 15 - 200x42

NOTES:

1. D = member depth, B = member breadth, NS = not suitable.
2. The above table was based on a batten spacing of 900 mm
3. Maximum birdsmouth depth = 30 % of rafter depth
4. End bearing lengths = 35 mm at end supports and 42 mm at internal supports for continuous members. Subscript values Indicate the minimum additional bearing length where required to be greater than 35 mm at end supports and 42 mm at Internal supports
5. Construction loads shall not be applied to overhangs until a 190x19 (minimum) timber fascia or other fascia of equivalent stiffness is rigidly and permanently attached to the end of rafter overhangs
6. Rafter spacing up to 1200 mm
7. Not all sizes of SmartLVL in this table are stocked in each state. Please check with your supplier before ordering.

Single/continuous span roof rafter - with ceiling attached AS 4055 classification C1, C2 and C3

Maximum Birdsmouth = 30% of rafter depth

EXAMPLE:

wind speed = C3

tile roof - 75 kg/m²

rafter/truss spacing = 600 mm

rafter span = 5800 mm

Enter span table at rafter spacing of 600 mm, and read down to a span equal to or greater than 5800 mm for the 75 kg/m² row

ADOPT:

SmartLVL 15 - 300x42

NOTES:

1. D = member depth, B = member breadth, NS = not suitable.
2. The above table was based on a batten spacing of 900 mm
3. Maximum birdsmouth depth = 30 % of rafter depth
4. End bearing lengths = 35 mm at end supports and 42 mm at internal supports for continuous members. Subscript values Indicate the minimum additional bearing length where required to be greater than 35 mm at end supports and 42 mm at Internal supports
5. Construction loads shall not be applied to overhangs until a 190x19 (minimum) timber fascia or other fascia of equivalent stiffness is rigidly and permanently attached to the end of rafter overhangs
6. Rafter spacing up to 1200 mm
7. Not all sizes of SmartLVL in this table are stocked in each state. Please check with your supplier before ordering.

Single/continuous span roof rafter - without ceiling attached

AS 4055 classification N1, N2 and N3

EXAMPLE:

wind speed = N3
 sheet roof - 40 kg/m²
 rafter/truss spacing = 600 mm
 rafter span = 5800 mm (single span)
 Enter span table at rafter spacing of 600 mm, and read down to a span equal to or greater than 5800 mm for 40 kg/m² row

ADOPT:

SmartLVL 15 - 200x42

NOTES:

1. D = member depth, B = member breadth, NS = not suitable.
2. The above table was based on a batten spacing of 900 mm
3. Maximum birdsmouth depth = 30 % of rafter depth
4. End bearing lengths = 35 mm at end supports and 42 mm at internal supports for continuous members. Subscript values indicate the minimum additional bearing length where required to be greater than 35 mm at end supports and 42 mm at internal supports
5. Construction loads shall not be applied to overhangs until a 190 x 19 (minimum) timber fascia or other fascia of equivalent stiffness is rigidly and permanently attached to the end of rafter overhangs
6. Rafter spacing up to 1200 mm
7. Not all sizes of SmartLVL in this table are stocked in each state. Please check with your supplier before ordering.

Single/continuous span roof rafter - without ceiling attached

AS 4055 classification C1, C2 and C3

Maximum Birdsmouth = 30% of rafter depth

EXAMPLE:

wind speed = C3

sheet roof - 40 kg/m²

rafter/truss spacing = 600 mm

rafter span = 5800 mm

Enter span table at rafter spacing of 600 mm, and read down to a span equal to or greater than 5800 mm in the 40 kg/m² row

ADOPT:

SmartLVL 15 - 200x42

NOTES:

See notes on page 40

Single span ridge/intermediate roof beam AS 4055 classification N1, N2 and N3

EXAMPLE:

Enter single span table at 3000 roof load width with column and read down to span equal to or greater than 4500 mm in the 40 kg/m² row

ADOPT:

SmartLVL 15 - 300x42

Roof load width (mm)		1500		3000		4500		6000		7500	
Member size DxB (mm)	Roof mass (kg/m ²)	span	O/H	span	O/H	span	O/H	span	O/H	span	O/H
Maximum recommended Ridge or Intermediate roof beam span - Single span (mm)

NOTES:

1. D = member depth, B = member breadth, NS = not suitable
2. End bearing lengths = 35 mm at end supports and 70 mm at internal supports for continuous members. Subscript values indicate the minimum additional bearing length where required to be greater than 35 mm at end supports and 70 mm at internal supports
3. Maximum rafter spacing up to 1200 mm
4. Not all sizes of SmartLVL in this table are stocked in each state. Please check with your supplier before ordering.

Single span ridge/intermediate roof beam AS 4055 classification C1, C2 and C3

EXAMPLE:

Enter single span table at 3000 roof load width with column
And read down to span equal to or greater than 4500 mm in the 40
kg/m² row

ADOPT:

SmartLVL 15 -2/240x42

NOTES:

1. D = member depth, B = member breadth, NS = not suitable
2. End bearing lengths = 35 mm at end supports and 70 mm at internal supports for continuous members. Subscript values indicate the minimum additional bearing length where required to be greater than 35 mm at end supports and 70 mm at internal supports
3. rafter spacing up to 1200 mm
4. Not all sizes of SmartLVL in this table are stocked in each state. Please check with your supplier before ordering.

Single span verandah beam AS 4055 classification N1, N2 and N3

EXAMPLE:

wind speed = N3
sheet roof - 40 kg/m²
rafter/truss spacing = 600 mm
verandah span = 3500 mm
roof load width = 3900 mm
Enter span table at 4500 roof load width column, rafter spacing of 600 mm, and read down to a span equal to or greater than 3500 mm in the 40 kg/m² row

ADOPT:

SmartLVL 15 - 300x42

(with additional bearing length of 5 mm required)

NOTES:

1. D = member depth, B = member breadth, NS = not suitable.
2. End bearing lengths = 45 mm at end supports and 70 mm at internal supports for continuous members. Subscript values indicate the minimum additional bearing length where required to be greater than 35 mm at end supports and 70 mm at internal supports
3. Restraint value for slenderness calculations is 1200 mm
4. Not all sizes of SmartLVL in this table are stocked in each state. Please check with your supplier before ordering.

Single span Verandah beam AS 4055 classification C1, C2 and C3

EXAMPLE:

wind speed = C3
sheet roof - 40 kg/m²
rafter/truss spacing = 600 mm
verandah span = 3500 mm
roof load width = 3900 mm
Enter span table at 4500 roof load width column, rafter spacing of 600 mm, and read down to a span equal to or greater than 3500 mm in the 40 kg/m² row

ADOPT:

SmartLVL 15-300x42
(with additional 30 mm bearing required)

Roof load width (mm)		1500		3000		4500		6000		7500

NOTES:

1. D = member depth, B = member breadth, NS = not suitable.
2. End bearing lengths = 35 mm at end supports and 70 mm at internal supports for continuous members. Subscript values indicate the minimum additional bearing length where required to be greater than 35 mm at end supports and 70 mm at internal supports
3. Restraint value for slenderness calculations is 1200 mm
4. Not all sizes of SmartLVL in this table are stocked in each state. Please check with your supplier before ordering.

Hip rafter - sheet and tile roof

AS 4055 wind classification N1 - N3 and C1 - C3

EXAMPLE:

wind speed = N3
 roof load = 40 kg/m² (sheet roof)
 hip rafter span = 4500 mm (single span)
 rafter spacing = 600 mm

Enter column at (N1-N3) wind speed, 600 mm rafter spacing and read down to span equal to or greater than 4500 mm for a 40 kg/m² roof load

ADOPT: SmartLVL 15 - 240x42

NOTES:

1. D = member depth, B = member breadth, NS = not suitable.
2. The above table was based on a batten spacing of 900 mm
3. Minimum backspan = 200 % of overhang, Maximum birdsmouth depth = 30 % of depth
4. End bearing length = 35 at end supports. Subscript values indicate the minimum additional bearing length where required to be greater than 35 mm at end support
6. Construction loads shall not be applied to overhangs until a 190 x 19 mm (min) timber fascia or other fascia of equivalent stiffness is rigidly and permanently attached to the end of rafter overhangs
7. Not all sizes of SmartLVL in this table are stocked in each state. Please check with your supplier before ordering..

Underpurlins - sheet and tiled roof AS 4055 wind classification N1 - N3

EXAMPLE:

wind speed = N3
rafter spacing = 1200 mm
roof load = 20 kg/m² (sheet roof)
underpurlin span = 3500 mm (single span)

'X' (total of rafter span) = 5400 mm
roof load width = 'X' / 2 = 5400 / 2 = 2700 mm

Enter single span table at 2700 mm roof load width column, 1200 rafter spacing and read down to span equal to or greater than 3500 mm at a 20 kg/m² row

ADOPT:

Counter beam supporting hanging beam AS 4055 classification N1, N2 and N3

ceiling mass - 20 kg/m²

EXAMPLE:

wind speed = N3
total of hanging beam span = 6400 mm
ceiling load width = 'X' / 2 = 6400 / 2 = 3200 mm

counter beam span = 4500 mm

Enter column at 3600 mm ceiling load width and read down to a span greater than or equal to 4500 mm

ADOPT:

SmartLVL 15 - 240x42

Strutting beam supporting underpurlins AS 4055 classification N1- N3

EXAMPLE:

wind speed = N3
 sheet roof = 20 kg/m²
 total of underpurlin span 'A' = 5000 mm
 total of rafter span 'B' = 4200 mm
 roof area supported = $(A/2) \times (B/2)$
 = $(5000/2) \times (4200/2)$
 = 5250000 mm² (Convert to m²)
 = 5250000/1000000 = 5.25 m²

strutting beam span = 4500 mm

Enter column at 6 m² roof area supported and read down to a span greater than or equal to 4500 mm at the 20 kg/m² row

ADOPT:

NOTES:

1. D = member depth, B = member breadth, NS = not suitable.
2. Minimum bearing length = 70 mm at end supports.
3. Restraint value for slenderness calculations is 1500 mm
4. Not all sizes of SmartLVL in this table are stocked in each state. Please check with your supplier before ordering.
5. Top edge of strutting beams with D/B > 3 shall be laterally restrained as per details on 9
6. Value in subscript indicate extra bearing length required

Strutting/counter beam supporting underpurlins & hanging beam AS 4055 classification N1- N3

ceiling mass - 20 kg/m²

EXAMPLE:

wind speed = N3
sheet roof = 40 kg/m²
total of underpurlin span 'A' = 5000 mm
total of rafter span 'B' = 4200 mm
roof area supported = (A/2) x (B/2)
= (5000/2) x (4200/2)
= 5250000 mm² (Convert to m²)
= 5250000/1000000 = 5.25 m²

total of hanging beam span 'X' = 4500 mm
effective beam spacing = 'X' / 2 = 4500 / 2 = 2250 mm
strutting counter beam span = 4500 mm

Enter column at 3600 mm effective beam spacing, 6 m² roof area supported and read down to a span greater than or equal to 4500 mm at the 40 kg/m² row

ADOPT:

NOTES:

1. D = member depth, B = member breadth, NS = not suitable.
2. Minimum bearing length = 70 mm at end supports
3. The above table was based on a maximum ceiling mass of 20 kg/m²
4. Top edge of strutting/counter beams with D/B > 3 shall be laterally restrained as per details on page 9
5. Not all sizes of SmartLVL in this table are stocked in each state. Please check with your supplier before ordering.

Strutting/counter beam supporting underpurlins & hanging beam AS 4055 classification C1 - C3

ceiling mass - 20 kg/m²

EXAMPLE:

wind speed = C3

sheet roof = 40 kg/m²

total of underpurlin span 'A' = 5000 mm

total of rafter span 'B' = 4200 mm

roof area supported = (A/2) x (B/2)

= (5000/2) x (4200/2)

= 5250000 mm² (Convert to m²)

= 5250000/1000000 = 5.25 m²

total of hanging beam span 'X' = 4500 mm

effective beam spacing = 'X' / 2 = 4500 / 2 = 2250 mm

strutting counter beam span = 4500 mm

Enter column at 3600 mm effective beam spacing, 6m² roof area supported and read down to a span greater than or equal to 4500 mm at the 40 kg/m² row

NOTES:

1. D = member depth, B = member breadth, NS = not suitable.
2. Minimum bearing length = 70 mm at end supports.
3. The above table was based on a maximum ceiling mass of 20 kg/m²
4. Top edge of strutting/counter beams with D/B > 3 shall be laterally restrained as per details on page 9
5. Not all sizes of SmartLVL in this table are stocked in each state. Please check with your supplier before ordering.

Strutting/hanging beam AS 4055 classification N1 - N3

ceiling mass - 20 kg/m²

EXAMPLE:

wind speed = N3

sheet roof = 40 kg/m²

A = 5000 mm, B = 4200 mm

roof area supported = (A/2) x (B/2)

= (5000/2) x (4200/2)

= 5250000 mm² (Convert to m²)

= 5250000/1000000 = 5.25 m²

strutting/hanging beam span = 4200 mm

ceiling joist span ('X') = 4400 mm

ceiling load width = ['X' / 2] = 4400/2 = 2200 mm

Enter column at 3600 mm ceiling load width, 6 m² roof area supported and read down to a span greater than or equal to 4200 mm at the 40 kg/m² row

ADOPT:

SmartLVL 15 - 300x42

Roof area supported = A/2 x B/2 Ceiling load width = X/2

NOTES:

1. D = member depth, B = member breadth, NS = not suitable.
2. The above table was based on a maximum ceiling mass of 20 kg/m²
3. Minimum bearing length = 70 mm at end supports. Subscript values indicate the minimum additional bearing length
4. Top edge of strutting/hanging beams with D/B > 3 shall be laterally restrained as per detail on page 9
5. Not all sizes of SmartLVL in this table are stocked in each state. Please check with your supplier before ordering.

Ceiling joists AS 4055 wind classification N1-N3 and C1-C3

Ceiling mass 20 kg/m²

EXAMPLE:

wind speed = N3
ceiling mass = 20 kg/m²
ceiling Joist span = 4500 mm (single span)
ceiling Joist spacing = 450 mm

Enter single span table at 450 mm in joist spacing column,
read down to a span equal to or greater than 4500 mm

ADOPT:

SmartLVL 15 - 140x42

NOTES:

1. D = member depth, B = member breadth
2. Do not walk on joists during construction unless a construction plank is in place
3. Minimum end/internal bearing length of 70 mm
4. Not all sizes of SmartLVL in this table are stocked in each state. Please check with your supplier before ordering
5. Ceiling space is not designed for storage purposes

SmartFrame Warranty

All SmartFrame Engineered Wood Products (EWP) are covered by our SmartFrame warranty against material and workmanship defects and are guaranteed to perform as specified when stored, installed, and finished in accordance with SmartFrame installation instructions.
